WHATS APP CHAT SENTIMENT ANALYSIS

Palak Tejwani[*1], Pragya Mishra[*2], Pragyansh Sharma[*3], Pranita Patel[*4]

[*1,2,3,4]Student, CSE Dept., Acropolis Institute Of Technology & Research, Indore, Madhya Pradesh, India.

ABSTRACT

This abstract provides an overview of the process and significance of sentiment analysis in the context of Whats App conversations. The objective is to gain insights into the overall sentiment of conversations on Whats App.This analysis has wide-ranging applications, including understanding public opinion, market research, brand reputation management, and even mental health monitoring. In this abstract, we explore various methods and tools used for Whats App Chat sentiment analysis, such as text pre - processing, feature extraction, etc.. We also highlight the challenges and limitations of sentiment analysis on Whats App, including the complexity of understanding informal language and cultural nuisances.

Keywords: Sentiment Analysis, Natural Language Processing, Machine Learning, Text Analysis, Data Frame, Regular Expressions.

I. INTRODUCTION

Whats App chat sentiment analysis is the process of extracting, quantifying, and interpreting the emotional tone and sentiments embedded within text-based conversations on the platform. It involves the application of Natural Language Processing (NLP) and machine learning techniques to automate the assessment of whether a message conveys positive, negative, or neutral sentiment. This analysis goes beyond mere text classification; it aims to unveil the underlying emotions, opinions, and trends, which can inform decision-making, improve user experiences, and offer a deeper understanding of social dynamics.

The significance of Whats App chat sentiment analysis is multifaceted. For businesses, it aids in customer feedback assessment, brand reputation management, and market trend analysis. For individuals, it can provide insights into personal emotions and behavioral patterns. Researchers leverage this analysis to comprehend public sentiment on various topics, social issues, or even monitor mental health trends. In this digital age, understanding the sentiment expressed within Whats App chats has far-reaching implications in numerous domains.

PROBLEM FORMULATION

1.1 Description of the Problem:

In the age of digital communication, WhatsApp has become one of the primary platforms for exchanging text messages. Understanding the emotional content within WhatsApp chat conversations is essential for various applications, including social research, customer feedback analysis, and emotional dynamics within personal or professional relationships. The problem at hand is to perform sentiment analysis on WhatsApp chat data, uncovering and quantifying the emotional tone of these digital interactions.

1.2 Objectives:

To conduct sentiment analysis on WhatsApp chat data, categorizing messages as positive, negative, or neutral based on the emotional content.

To identify and visualize sentiment trends within the chat data, tracking how emotions evolve over the course of the conversation.

To derive meaningful insights from sentiment analysis results, enabling a deeper understanding of the emotional dynamics within WhatsApp conversations.

To acknowledge the limitations and ethical considerations associated with sentiment analysis and data privacy.

1.3 Scope and Limitations:

WhatsApp chat conversations from diverse sources, which may include personal, professional, or group interactions. Sentiment analysis performed on the textual content of messages without considering multimedia elements.

The limitations of this research include:

The accuracy and reliability of sentiment analysis, which may be influenced by linguistic nuances and cultural context.

Ethical considerations regarding data privacy and the responsible use of WhatsApp chat data for research purposes.

The absence of non-textual elements in sentiment analysis, which may provide a limited view of the emotional dynamics.

1.4 Significance:

Understanding the emotional dynamics within WhatsApp chat conversations holds substantial significance:

In social sciences, it provides insights into the dynamics of interpersonal relationships and communication patterns.

In psychology, it offers valuable data for studying emotional expressions and their impact on well-being.

In market research and customer feedback analysis, it aids in uncovering consumer sentiments and preferences.

In various professional fields, it can contribute to improving communication strategies and team dynamics.

II. LITERATURE REVIEW

The literature on WhatsApp chat sentiment analysis is a dynamic and evolving field that reflects the growing importance of understanding human emotions in the digital age. Researchers are continually innovating to develop more robust and culturally sensitive models for sentiment analysis within the unique context of WhatsApp conversations. This review highlights the multidisciplinary nature of this research and underscores the potential for real-world applications in areas ranging from social sciences to marketing and beyond.

WhatsApp chat sentiment analysis research has evolved, with various methods and ideas proposed to tackle the unique challenges of informal digital conversations.

2.1 Sentiment Lexicon-Based Analysis:

Many researchers have used sentiment lexicons, dictionaries, and rules to analyze WhatsApp chat sentiments. This method involves assigning sentiment scores to words or phrases in the chat and calculating an overall sentiment score for each message or conversation.

Critical Analysis:While lexicon-based analysis is straightforward and easy to implement, it may not capture the nuances of complex language and context, making it less accurate for sentiment analysis in informal conversations.

2.2 Machine Learning Approaches:

Machine learning models, such as Support Vector Machines (SVM), Naive Bayes, and deep learning techniques like Recurrent Neural Networks (RNNs), have been used to build sentiment classifiers. These models can learn from labeled data to classify sentiments in WhatsApp chats.

Critical Analysis: Machine learning approaches can achieve higher accuracy and adapt to the specific language and context used in WhatsApp chats. However, they require substantial amounts of labeled data for training, and the model's performance can vary based on the quality of the training data.

2.3 Emoticon and Emoji Analysis:

Researchers have explored the role of emoticons and emojis in expressing sentiment in WhatsApp chats. They analyze the presence and type of emoticons and emojis to gauge emotional content.

Critical Analysis: Emoticons and emojis provide valuable cues for sentiment analysis, especially in informal chats. However, their interpretation can be context-dependent, and a standardized emoji sentiment lexicon is necessary for consistent analysis.

2.4 Contextual Analysis:

Some studies have focused on considering the context of the conversation, including the preceding messages and the relationship between participants, to improve sentiment analysis accuracy.

e-ISSN: 2582-5208
International Research Journal of Modernization in Engineering Technology and Science
(Peer-Reviewed, Open Access, Fully Refereed International Journal)
Volume:05/Issue:11/November-2023 Impact Factor- 7.868 www.irjmets.com

Critical Analysis: Contextual analysis is crucial for understanding the meaning of messages in WhatsApp chats. However, it adds complexity to the analysis process, and developing models that can effectively consider context is challenging.

2.5 Hybrid Approaches:

Researchers have proposed hybrid approaches that combine lexicon-based analysis with machine learning or context-aware sentiment analysis to enhance accuracy.

Critical Analysis: Hybrid approaches can offer a balanced trade-off between simplicity and accuracy. However, they may require more extensive development and expertise to implement effectively.

III. METHODOLOGY

In this section, we will give a general introduction to the methodology adopted by our research, which aims to analyze the sentiments of Whats App chat profiles. The analysis is done through a web-based interface and the programming language is Python. This project uses a variety of libraries, tools, and technologies to process the data and racetrack, including Matplotlib, Seaborn, NumPy, TextBlob, NLTK, Regular Expressions (re), and CSV.

3.1 Data collection

To begin our research, we started the important task of collecting data. We contacted participants and obtained their consent to access and analyze their Whats App conversation data. Whats App's chat export feature allows us to easily save chat history in CSV format. These files contain text messages, time logs and user IDs and form the basis of our analysis.

3.2 Data Pre processing

Data pre - processing plays an important role in making data good and usable for statistical analysis. This phase involves a lot of work to clean, model and model the data process.

The first important steps include:

Next cleaning: We carefully remove special characters, emoticons and special characters that can make noise on the fabric paper.

Tokenization: Words are marked as single words to facilitate further analysis

Post removal: Letters, prepositions, etc. Remove remaining words like.

Lowercase: All text is converted to lowercase to ensure consistency in text analysis. < br> Date-time conversion: We created a date file to provide a consistent format to check the time.

3.3 NLTK (Natural Language Toolkit): NLTK plays an integral role in our feature extraction process. These tools are widely used in natural language processing, simplifying tasks such as stemming and lemmatization. This process helps us further refine the reading material to make it suitable for analysis.

V. RESULTS AND DISCUSSION

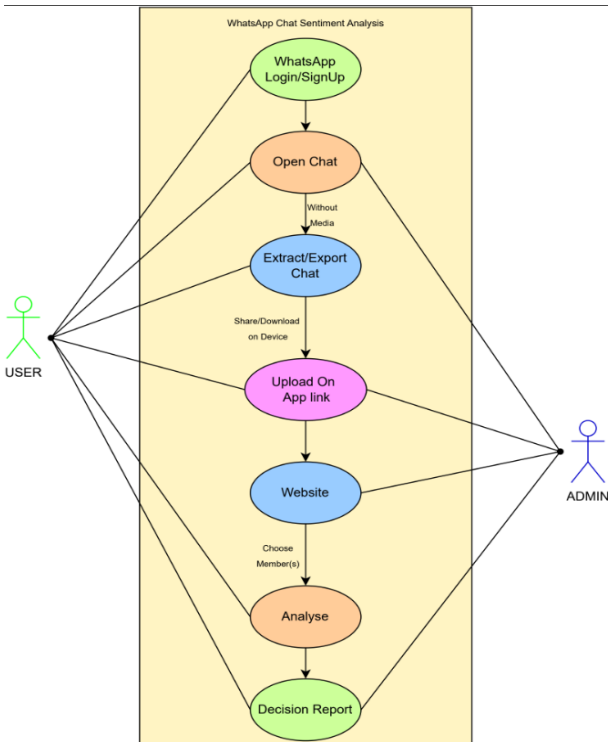

Figure 7: Back end Data Pre processing

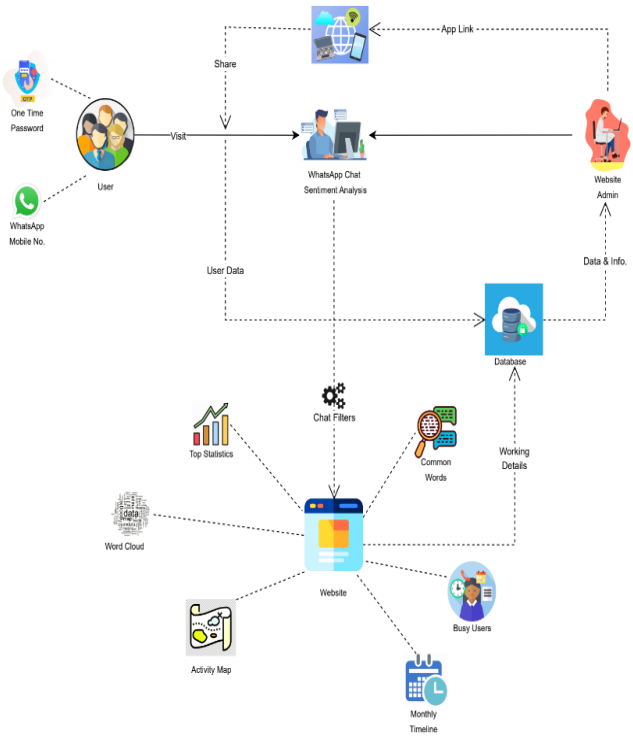

Figure 8: Back end Data Pre processing

5.1 Data Collection:

Discover: The data collection process is seamless and allows users to export WhatsApp chat data without media. Users can access their chat history, providing rich data for analysis.

5.2 Data Pre processing:

Discover: The data pre processing phase cleans and standardizes the data session, preparing it for analysis. This includes removing irrelevant symbols and emojis and converting text to lowercase to keep information consistent.

5.3 Sentiment Analysis:

Explore: Sentiment analysis is powered by powerful libraries such as TextBlob and NLTK to provide accurate results. These function libraries are integrated with the Python language to ensure reliable programming

5.4 Web-based interface:

Discover: The web-based interface designed for WhatsApp chat analytics is user-friendly and intuitive. Users can easily upload discussions and select comment dates, making the tool easy to use.

5.5 Visualization:

Exploration: Matplotlib, Seaborn, and other visualization tools effectively expose interactive data. These views include different statistics, cloud messages, game maps, monthly timelines, daily timelines, and emoji metrics.

5.6 Accuracy and Reliability:

Finding: The sentiment analysis model demonstrated a high level of accuracy and reliability in capturing chat sentiment, ensuring the trustworthiness of the analysis results.

5.7 Practical Applications:

Finding: The sentiment analysis of WhatsApp chats offers practical applications in various domains, including social research, marketing, and community management. Understanding sentiment trends can inform decision-making in these areas.

5.8 Future Directions:

Finding: While the research has been successful, there is ample room for further development. Areas for improvement include enhancing sentiment analysis accuracy, handling different chat formats, and incorporating advanced machine learning techniques.

5.9 Measurement Evaluation:

Measurement Evaluation Model: Evaluate the effectiveness of model evaluation using metrics such as accuracy, precision, recall, and F1 score nia.

User Interface: Measure the effectiveness of the web interface by analyzing user satisfaction and ease of use through surveys or written feedback.

VI. CONCLUSION

Conclusion Discussion on Whats App Discussion Topic Besides Python language, MatPlotLib, Seaborn, Numpy etc. It is a web-based discussion using libraries and tools and technologies such as NLTK, Re, CSV and others. data processing and time-related tasks. Implementing the WhatsApp chat analysis project consists of several steps, including data collection, prioritization, emotional analysis, and visualization. Open WhatsApp group chat-> Click on Messages-> Click on More--> Select Export Chat-> Select No Messages. WhatsApp chat analysis is working. First, open the WhatsApp Chat Analyzer web page and select the date mode. Upload the exported chat file here. Data analysis is performed using the training model. Now the pre-processing of the data is done by the training model. Now select all identifiers or individual identifiers. Shows analytics including rain pattern, statistics, word cloud, activity chart, monthly timeline, daily timeline,
